Typecasting is of two types:

- Implicit typecasting.
- Explicit typecasting.

Implicit typecasting

Implicit type casting is also known as Widening or Automatic type casting. When small range data type variable is converted into large range data type, The process is called implicit type casting.

byte >> short >> int >> long >> float >> double
Widening

Explicit typecasting

Explicit typecasting is also known as narrowing typecasting. When a large range data type is converted into small range data.

double >> float >> long >> int >> short >> byte
Narrowing
